

Case Study – Senior Manager, Product Data Analyst

Contentsquare story & context

Contentsquare is a digital experience analytics platform. Contentsquare empowers its clients to better understand the frictions their users might experience on their digital properties (websites, apps...), and to surface interesting website optimizations opportunities for brands (regarding website redesign, or web performance improvement).

Contentsquare's clients (example of clients: Toyota, Verizon, Ikea, Carrefour, Leroy Merlin...) pay license fees to Contentsquare every month, so that their team (web analysts, e-merchandisers,...) can extract data with our tool. Contentsquare clients generally commit to 24-months contracts. Once they commit, they cannot terminate the contract before the end.

At the end of their contract, a negotiation process generally starts to renew the contract for another two years. During this negotiation period, our clients' procurement teams are generally going to look at several factors : price, return on investment, usage, legal aspects, compliance with their other softwares....

Case Study Context

Contentsquare has launched a new product to offer user experience optimization for mobile applications on top of Web (CS Digital). We'll focus on this new product: **CS Apps**.

Part 1

After a year, the Product Director of CS Apps wants to assess if we should: stop the investment on CS Apps, maintain current investment or increase investment and build a case for the CPO.

Preliminary questions

1. How would you approach this problem? What are the hypotheses you would elaborate?

2. What data do you need to verify these hypotheses?

Data & Exploration

You can find in the 2 csvs a dump of data regarding mobile: the first dataset contains account level data and the second dataset contains user level data. 1. How would you proceed to assess the data quality of the dataset provided? a. If there are data quality problems: How would you approach them to have them solved at the source?

2. Data exploration: out of the dataset and the pre-defined hypotheses of part 1: highlight 2-3 insights to answer the problem.
3. What would you need to deepen your understanding of the situation that is not provided in this dataset? (could be qualitative or quantitative data, internal knowledge of other departments, market data etc...) What would be the other analyses you'd like to conduct?

Recommendations

Based on your analysis, provide strategic recommendations for the product. Consider aspects such as product improvements, marketing strategies, and potential new features.

Part 2: Additional question

Account health and adapting to AI:

Our traditional Health Score is becoming obsolete as our AI Agent Sense ([link](#) and other potential future features) reduces the 'human time' required to get value. As a Senior Manager, how would you lead your team to redefine 'Account Health' for our enterprise clients?

The Monetization Challenge:

Adapting pricing to the AI world. Contentsquare currently prices primarily on Session Volume or Seat Count. However, the Sense Analyst reduces the time users spend in the tool. If we stay with our current pricing model, we risk "Value Leakage"—where the client gets massive ROI from AI-driven insights but our revenue stays flat or

decreases because their "human session" count or "seat" requirements drop.

You are tasked with partnering with the **Director of Monetization** to design a new pricing and packaging strategy for the 'AI-First' era of Contentsquare.

What analysis would you run to determine if we should price the **Sense Analyst** as a *Flat-Fee Add-on*, a *Success-based Tier* (e.g., number of 'Critical Insights' surfaced), or a *Credit-based* model (e.g., number of AI-generated reports)?

Presentation and guidelines

Restitution

Build a deck presenting your findings and explaining the methodology used. You'll have 20 minutes to present and we'll use 40 minutes for Q&A. Please submit your deck 48h prior to the presentation.

General guidelines

We are more interested in knowing your reflection process, the questions you asked yourself, the things you choose to evaluate and to discard, more than the actual results of this analysis.

Don't worry too much about directions that reveal to be unsuccessful: what will be important for us is to understand why you wanted to take this direction and why it revealed to be successful or not.

Datasets description

Account Data

The 2 products we are referring to are CS Digital and CS Apps.

This dataset represents only CS Apps clients and not CS Digital clients.

- SALESFORCE_ACCOUNT_ID: unique identifier of an account
- GEO: geo of the account

- REGION: region of the account
- VERTICAL: vertical of the account
- FISCAL_QUARTER: quarter of the year
- MONTH: month of the year - If an account has a valid contract on a given month, the account will appear for this month
- HEALTHY_STATUS: health KPI defined as a ratio between ACV and WAU (ACV/WAU)
- CONTRACT_START_DATE: start of the contract, if a client has multiple contracts, all the contracts will show up
- CONTRACT_END_DATE: end of the contract, if a client has multiple contracts, all the contracts will show up
- IMPLEMENTATION_STATUS_APPS: implementation status for CS Apps product (lived means that the client can fully see its data on the product and partially lived means that the data is not fully available but the product can still be used)
- TOTAL_ACTIVE_ACV: Annual contract value (in \$) across all valid contracts on the given month (ACV) (for CS Digital, CS Apps and all other products/add ons the client has contracted with - Contentsquare used to sell 4 main products and some add ons)
- TOTAL_UFR: Up for Renewal value: the value of all contracts that will be renewed in the given fiscal quarter (in \$)
- UNIQUE_USERS: number of distinct users of the account who connected on the platform on the given month
- AVG_WAU_GLOBAL: average number of unique users per week registered during the month for the account on the whole product (WAU)
- CERTIFIED_USERS_DIGITAL: number of users who passed the certification for CS Digital and connected on the platform on the given month
- CERTIFIED_USERS_APPS: number of users who passed the certification for CS Apps and connected on the platform on the given month
- ACV_CS_APPS: Annual contract value for CS Apps product (in \$)

User Data

The dataset contains data for CS Apps clients only.

What is a "project"? An account can have multiple projects. A project refers to a specific website. It could be a country specific website, it could be a brand belonging to a group account (for instance Dior being a brand of the group LVMH). Project ID refers to the ID of the project.

- MONTH: month of the year with connections
- SALESFORCE_PROJECT_ID: unique identifier of an account
- PROJECT_ID: identifier of the project
- USER_ID: identifier of the user
- USER_TYPE: whether the user belongs to a partner account or a customer account
- USER_POSITION: the role of the user
- MODULE_NAME: name of the module visited by the user on CS Apps. The product has multiple modules.
- ATTRIBUTES: project attributes
- INDUSTRIES: project industry
- SESSIONS: number of the sessions of the user for the given month
